Monday.com, Whoop, Razorpay, Uber, BambooHR, MoEngage, Whatfix, Kaizen, Assured Allies, Arctic Wolf

Target audience

Mid Market, Enterprise

My role

- Partnered with the PM on the PRD
- Quantitative research
- Led design end to end

Team

- Product Manager
- Engineers
- Co-founder (CTO)

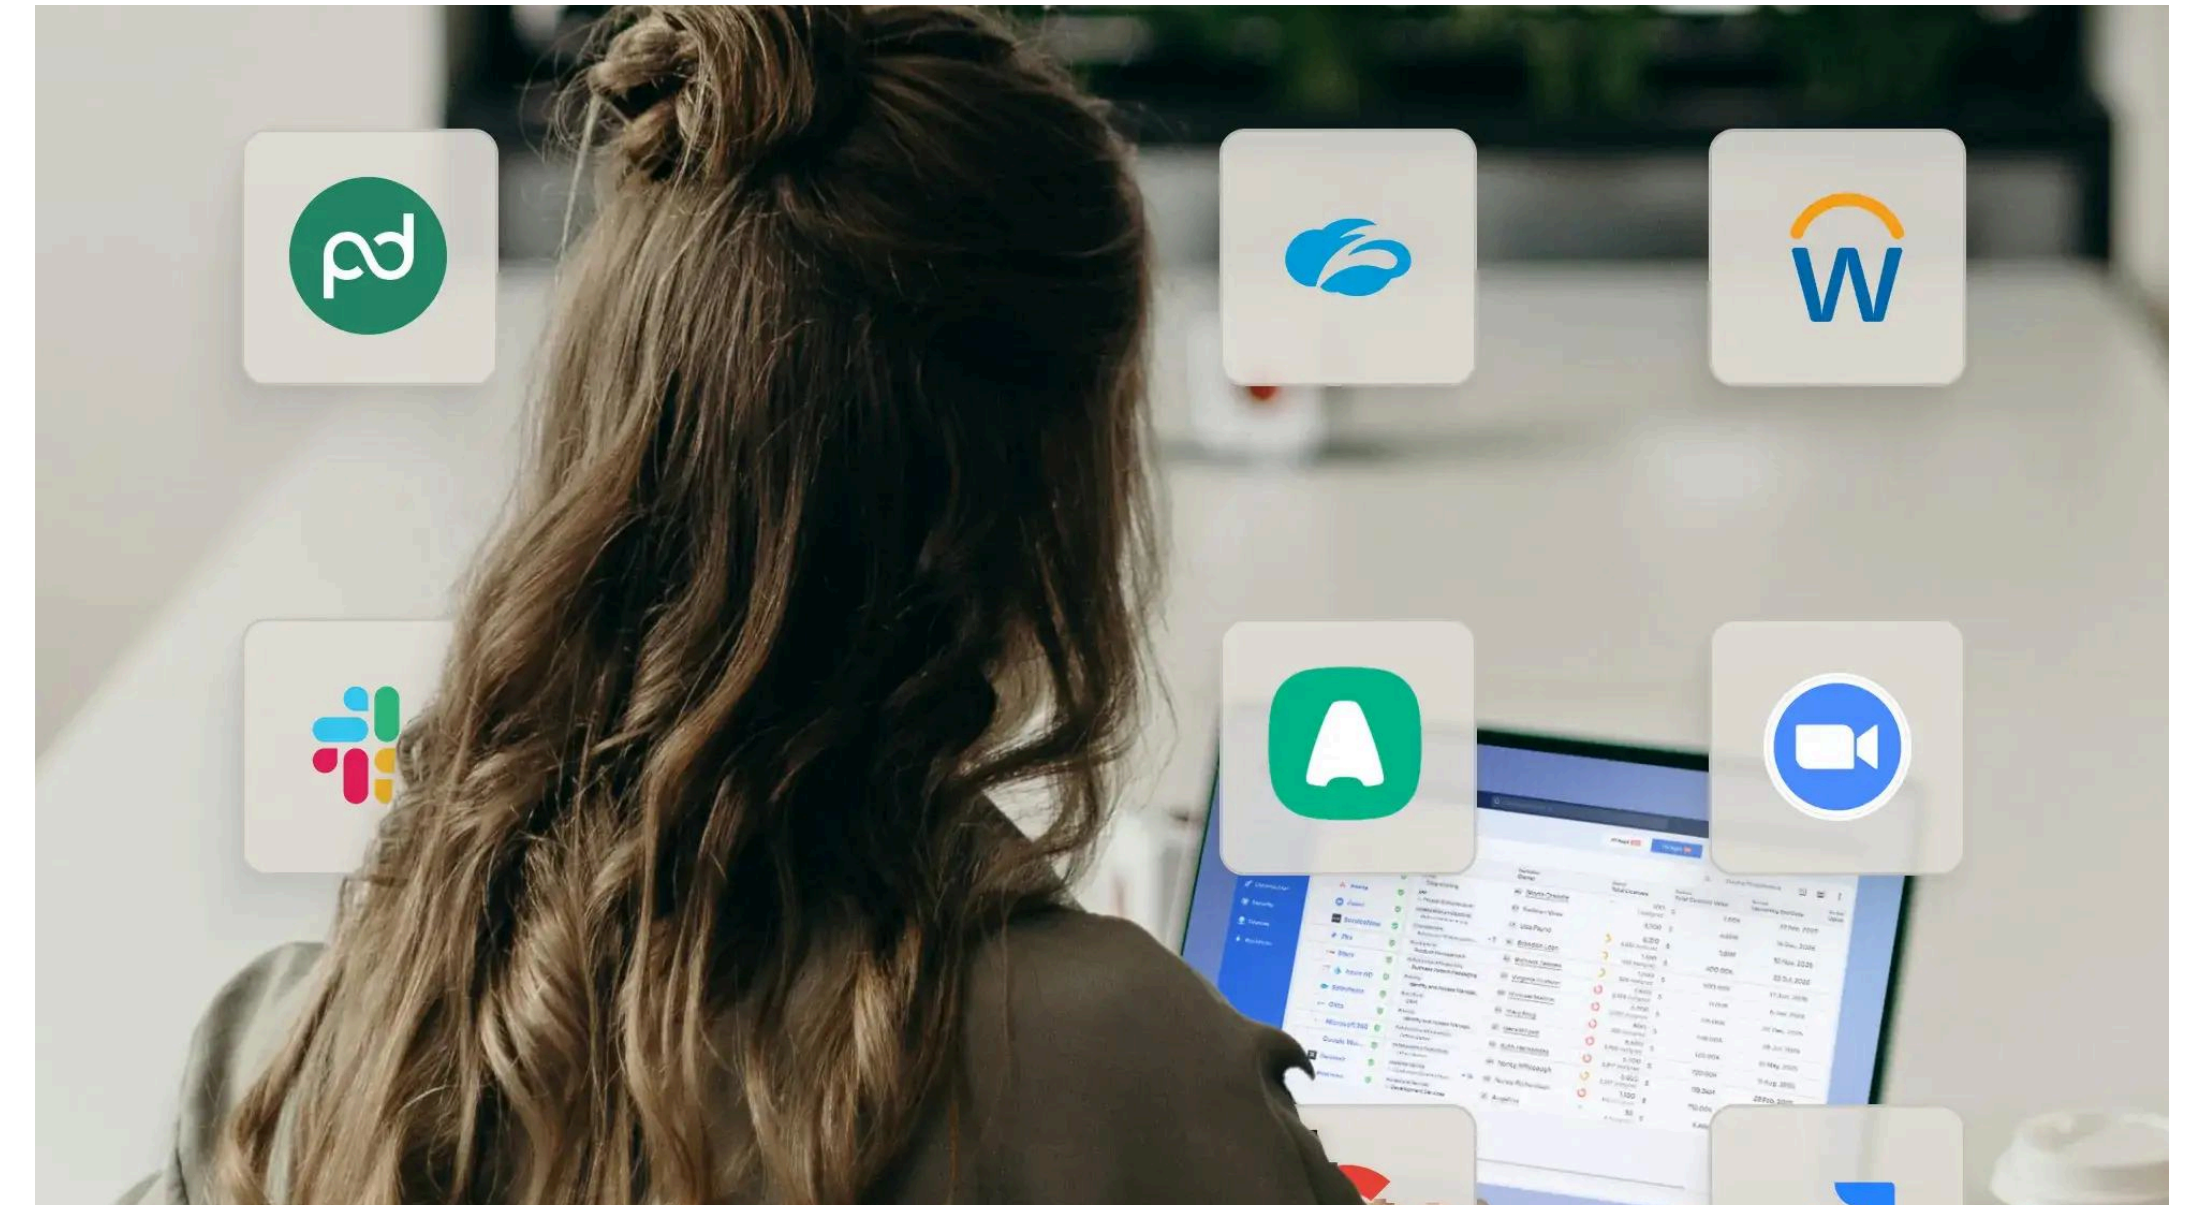

The Why and Who of Access Requests

Why do businesses care?

Enterprise customers look for trust certificates. Trust certificates are earned through IT Security audits.

Audits succeed when an org can prove, who has access to what software, repo, folders etc and why.

Who are the primary stakeholders?

Employee:

Requests access to software, repo, folder etc.

Approver:

Direct manager, Skip level managers, App owner, IT/Security team/ Compliance / Legal

What we were solving for this time

Faster decision making

Reduction in median approval time. Bringing down decision making time from days to minutes.

Confident decision making

Reduction in post-approval revocations. Fewer approvals get reversed later.

Research done to assess current reality

Competitor research

Question:

How do other products present risk and context?

Looked at:

Layout, interaction pattern, how recommendations are framed, how decisions are prompted.

Customer voice

Question:

What do customers say?

Looked at:

20 statements and asks from support calls at 11 companies, pulled from Pulse, a customer intelligence platform. We grouped them into 5 themes.

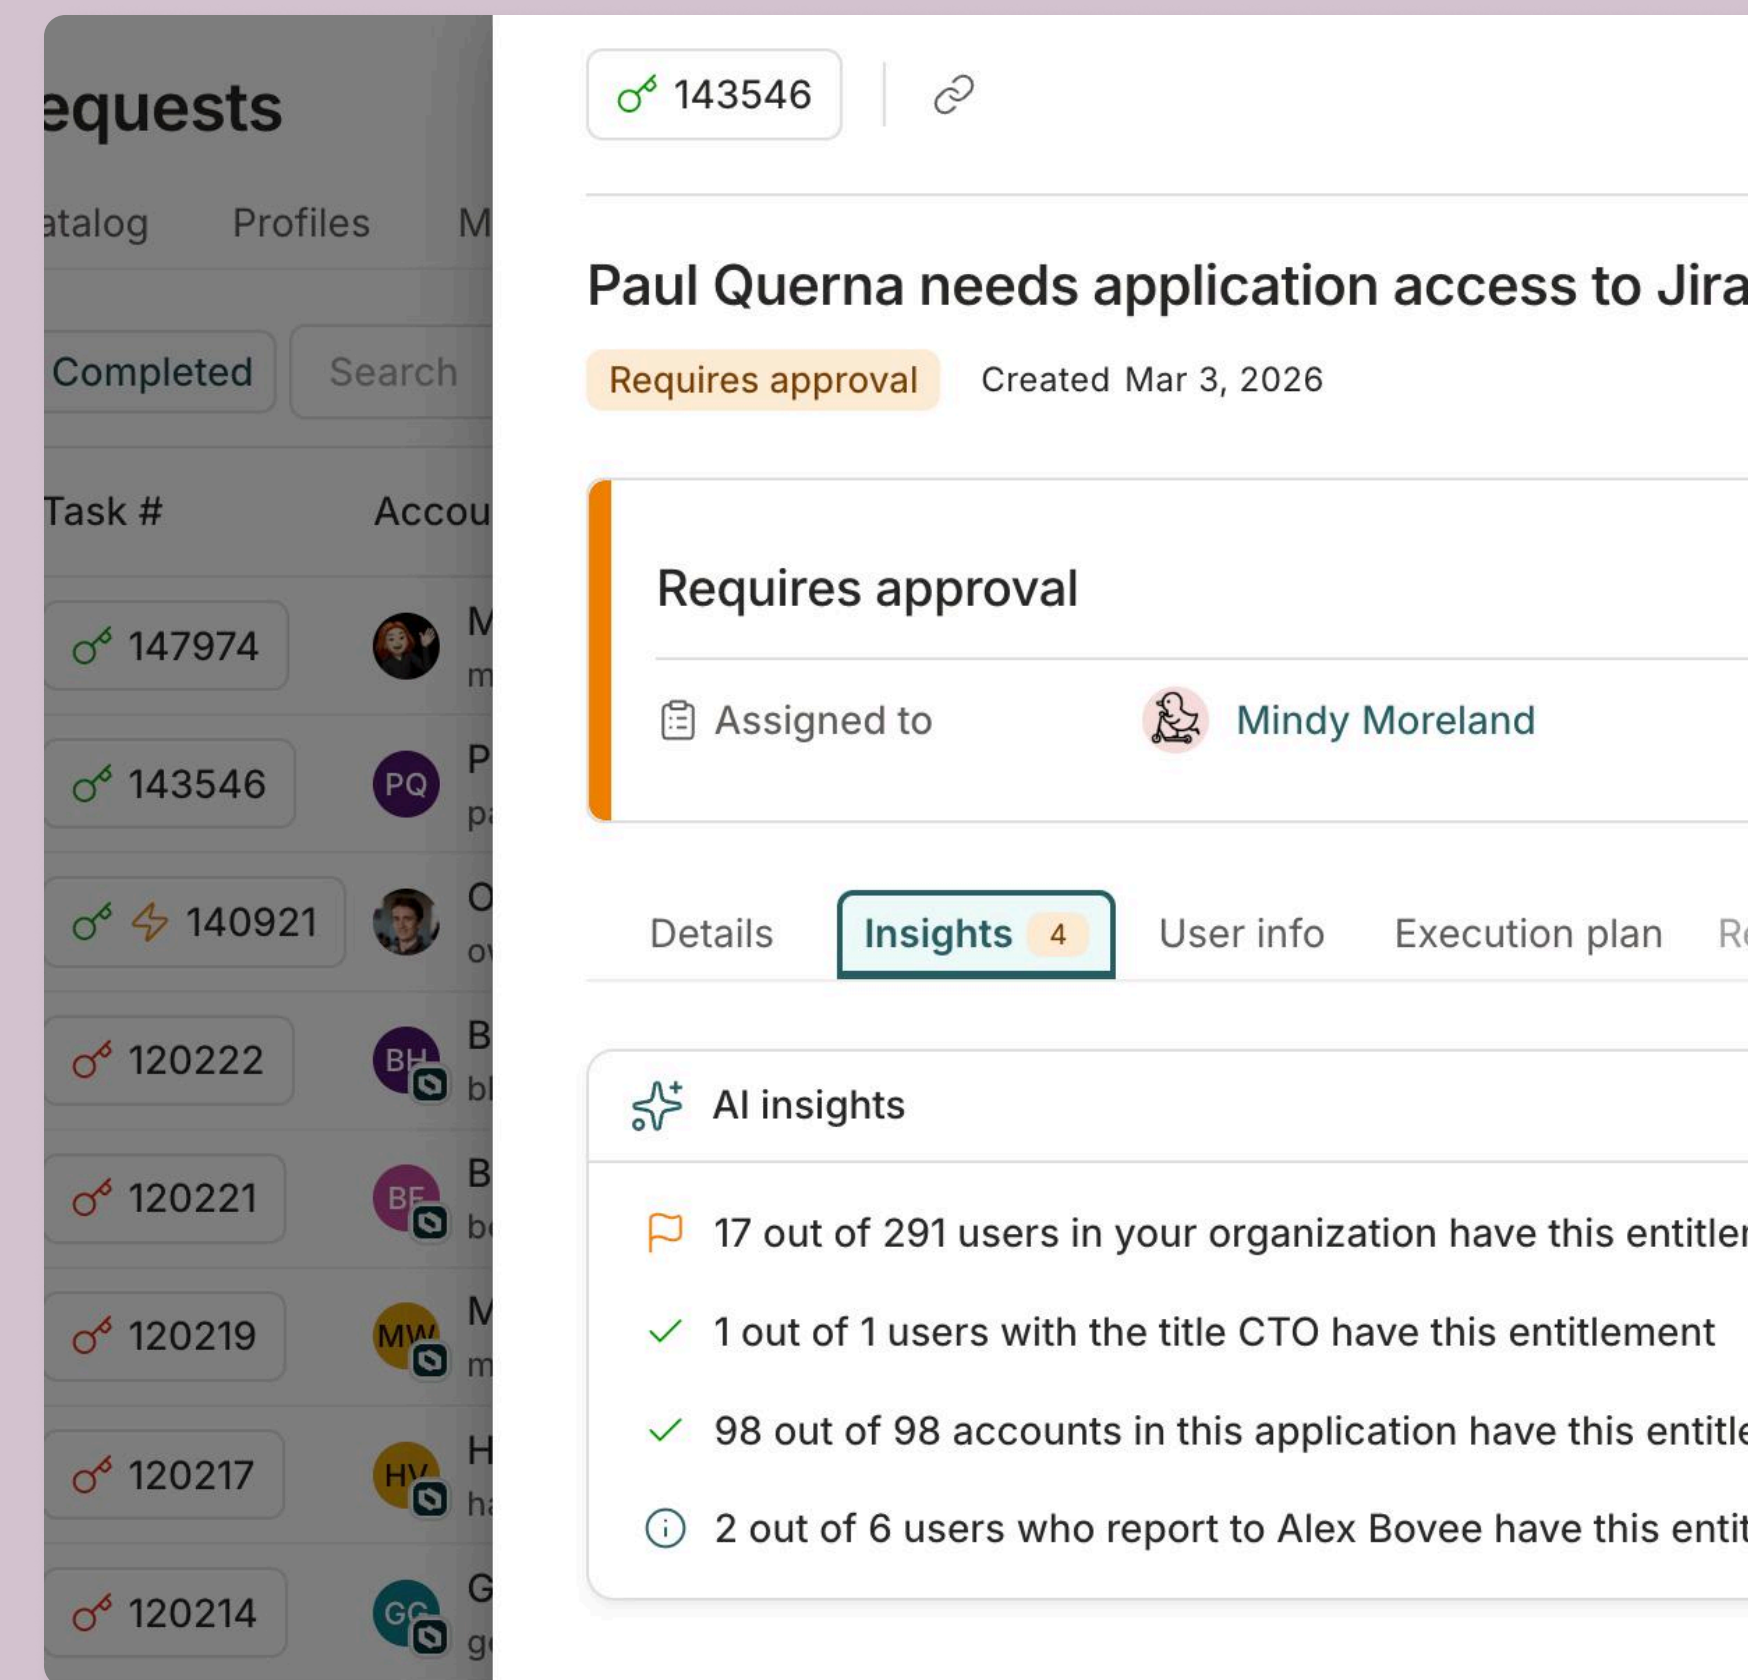

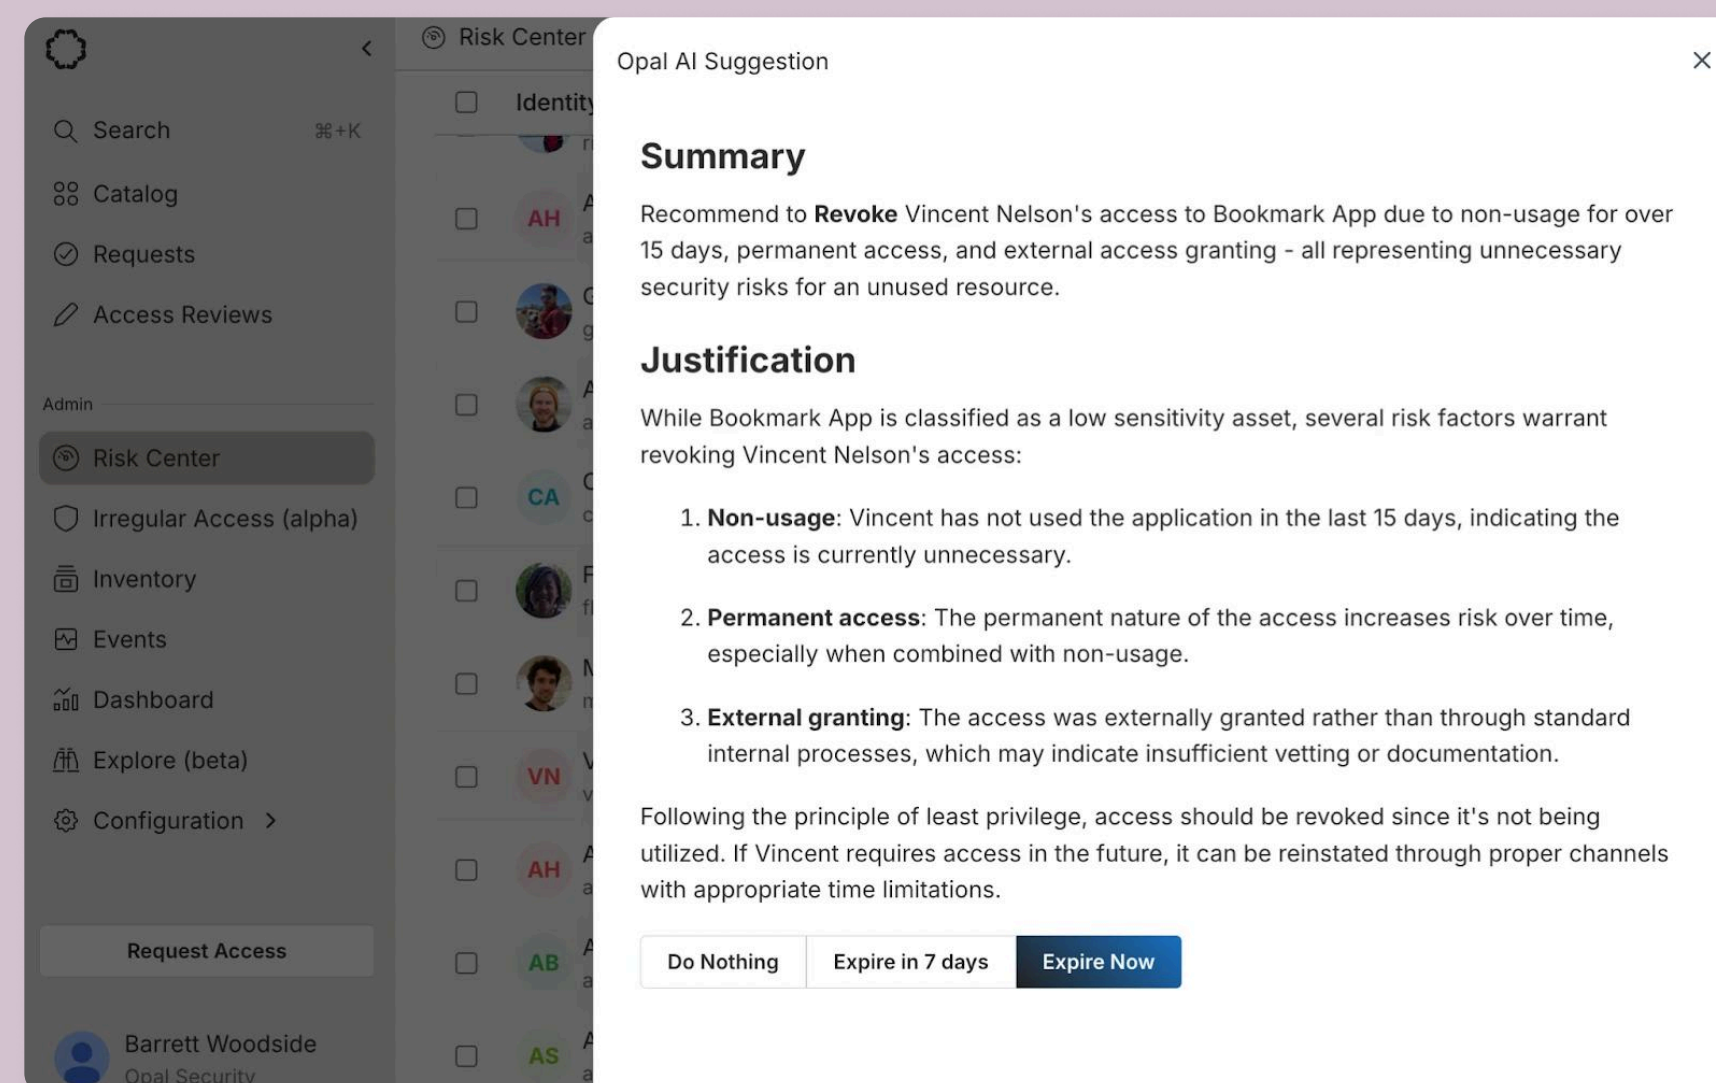

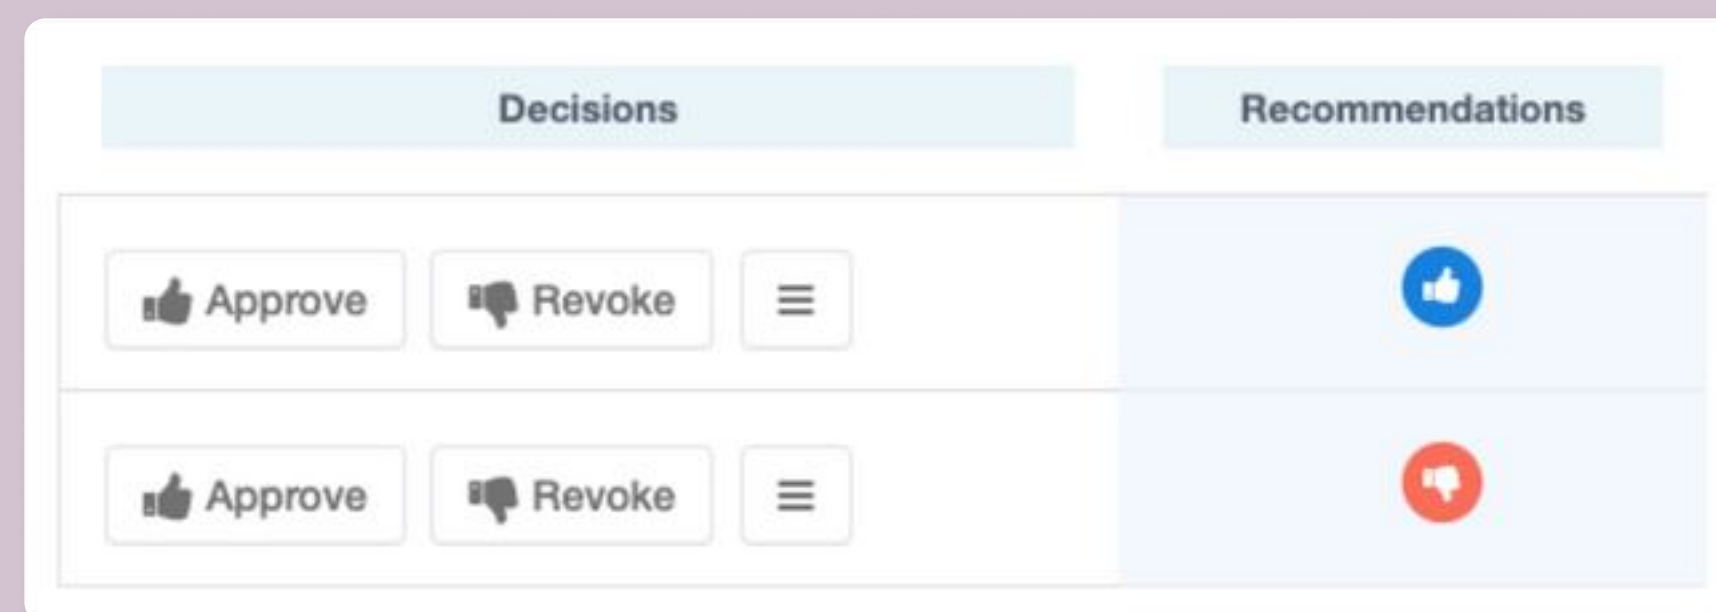

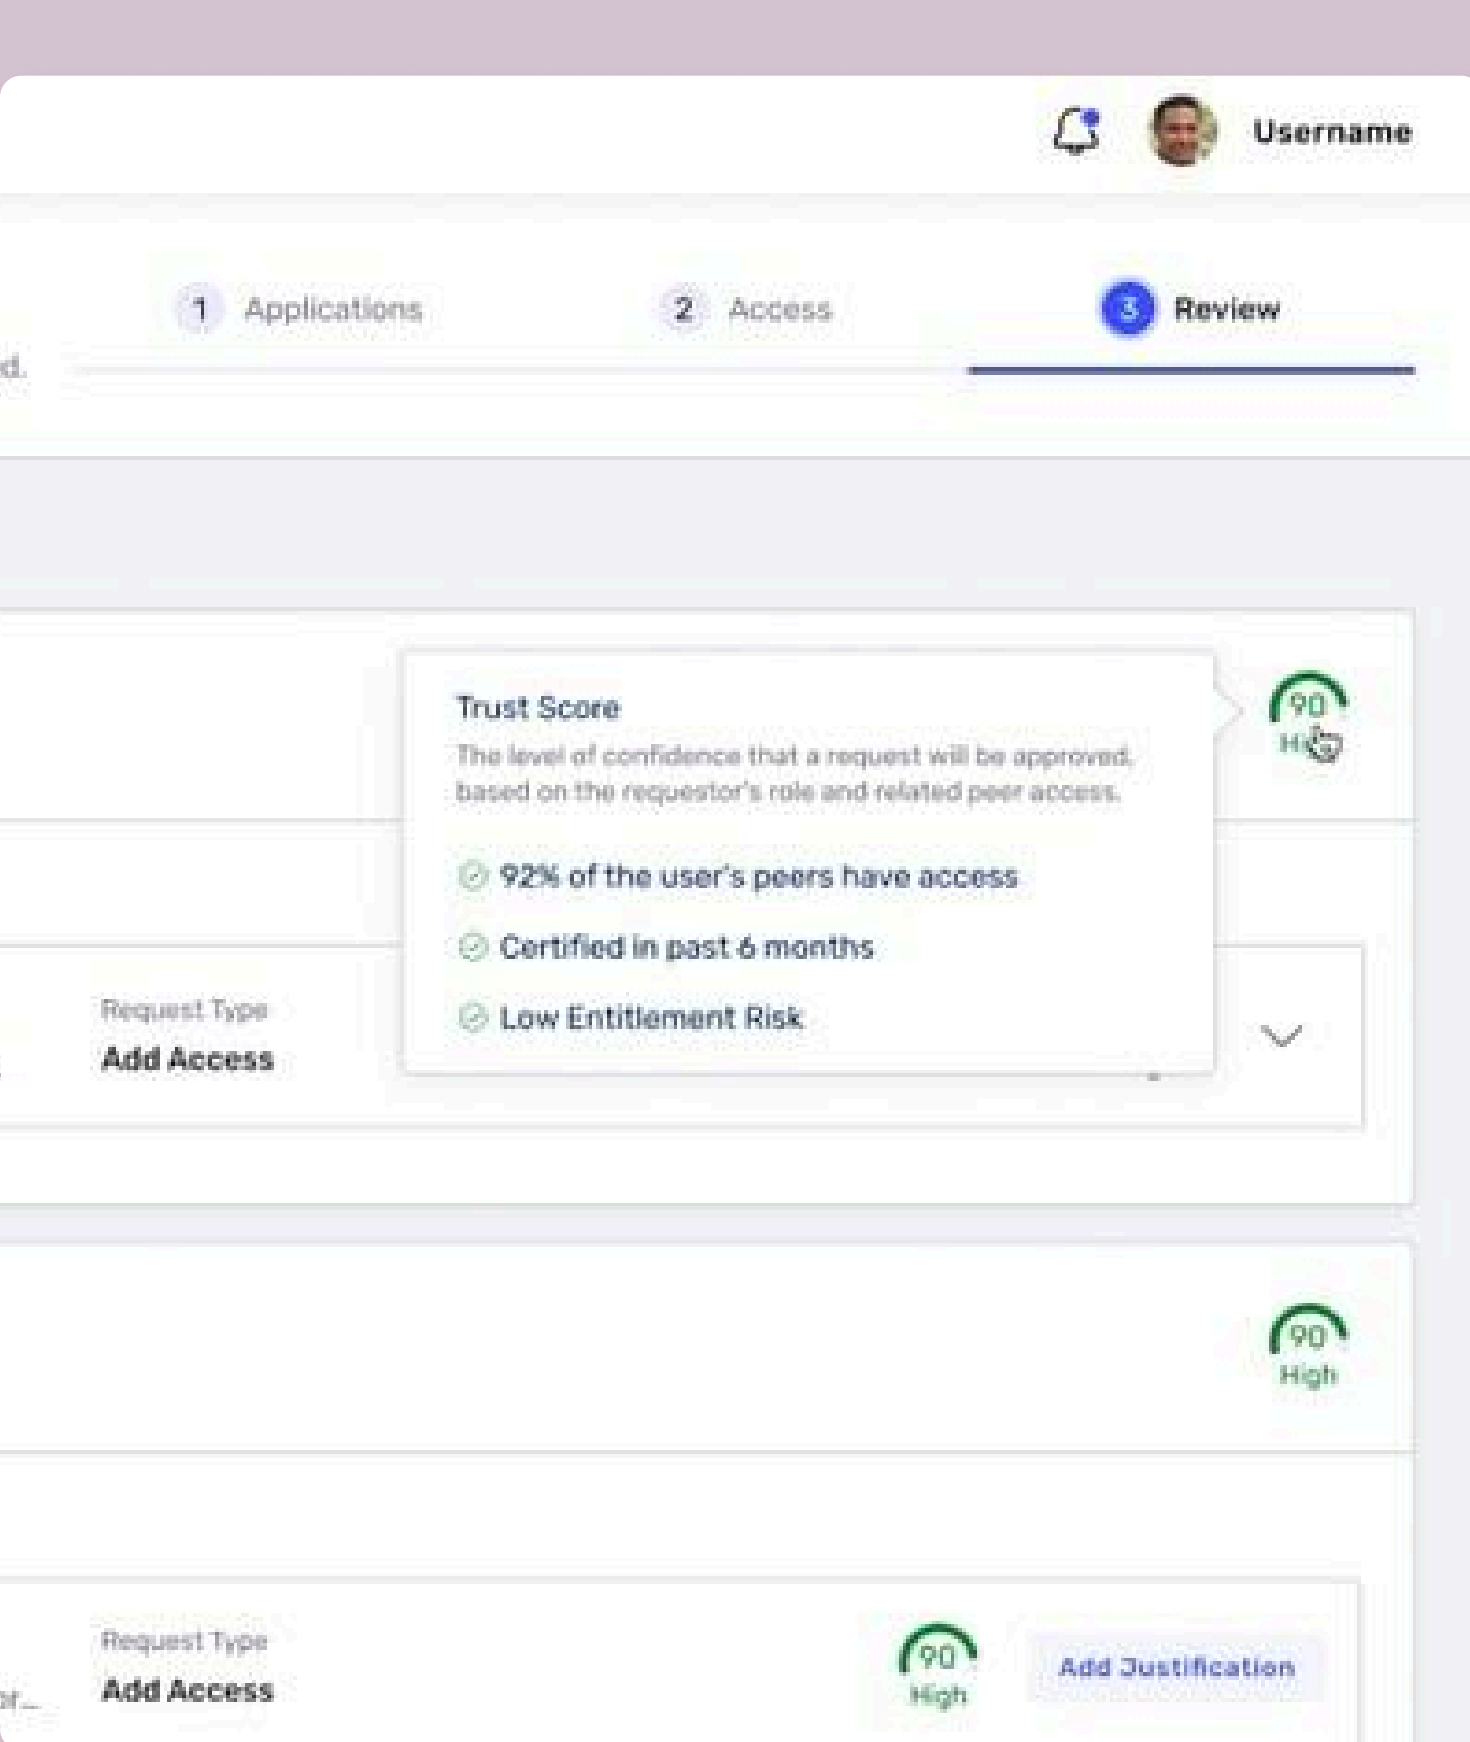

Heatmap analysis

Question:

What do approvers actually do?

Looked at:

Clickmap, scrollmap in Datadog RUM heatmaps

Researched 9 competitors

Studied layout and visual hierarchy, interaction pattern, content structure, decision framing etc

Key Takeaways - Competitor research

Layout, visual hierarchy

Insight is shown as a card or modal, not a full page, keeping the approver in flow

Bullet points used in the layout, not paragraphs, for scannability

A highlighted icon or pre-selected state used to nudge the approver softly

Interaction pattern

Two-step interaction only, context shown first, then the decision action

Approve or reject buttons kept close to the context, no scrolling needed

Content structure

Context has 3 to 4 strong pointers only, not the full list

Numbers placed early in the copy, within the first 4 to 5 words, for quick scanning

Decision framing

Packaged as a recommendation, not as a directive

Copy nudges approver toward two actions i.e Decide or Prioritize

AI flags risk at two levels: the decision (approve or deny) and the context (why it's risky)

Historical & audit context (6)

"The approver needs context regarding the current user access."
— BBC

"Include access history on the approval screen."
— Radicant Bank

"The approver should view the history of access changes."
— Kasada

"Show previous decisions made on approvals."
— J.G. Wentworth

"Indicate if access was recently certified."
— BBC

"The approver needs a consolidated view of access."
— Arctic Wolf

Risk visibility (5)

"Display risk level prior to approval."
— Arctic Wolf

"Highlight permissions that are excessive."
— Somos

"Alert for violations during the approval process."
— OakNorth Bank

"Visually highlight roles that are high-risk."
— Arctic Wolf

"Flag unusual combinations of access."
— Moonfare

Decision support (4)

"Show insights comparing peers."
— Lunar Fare

"Provide a summary of the impact analysis."
— Radicant Bank

"Implement a recommendation engine."
— Paidy

"The approval screen lacks support for decision-making."
— Kasada

Usage & entitlement data (3)

"Display details of last access usage."
— Paidy Solutions

"Provide a summary of entitlement counts."
— Somos

"Provide a summary of the user's critical access."
— Harry's

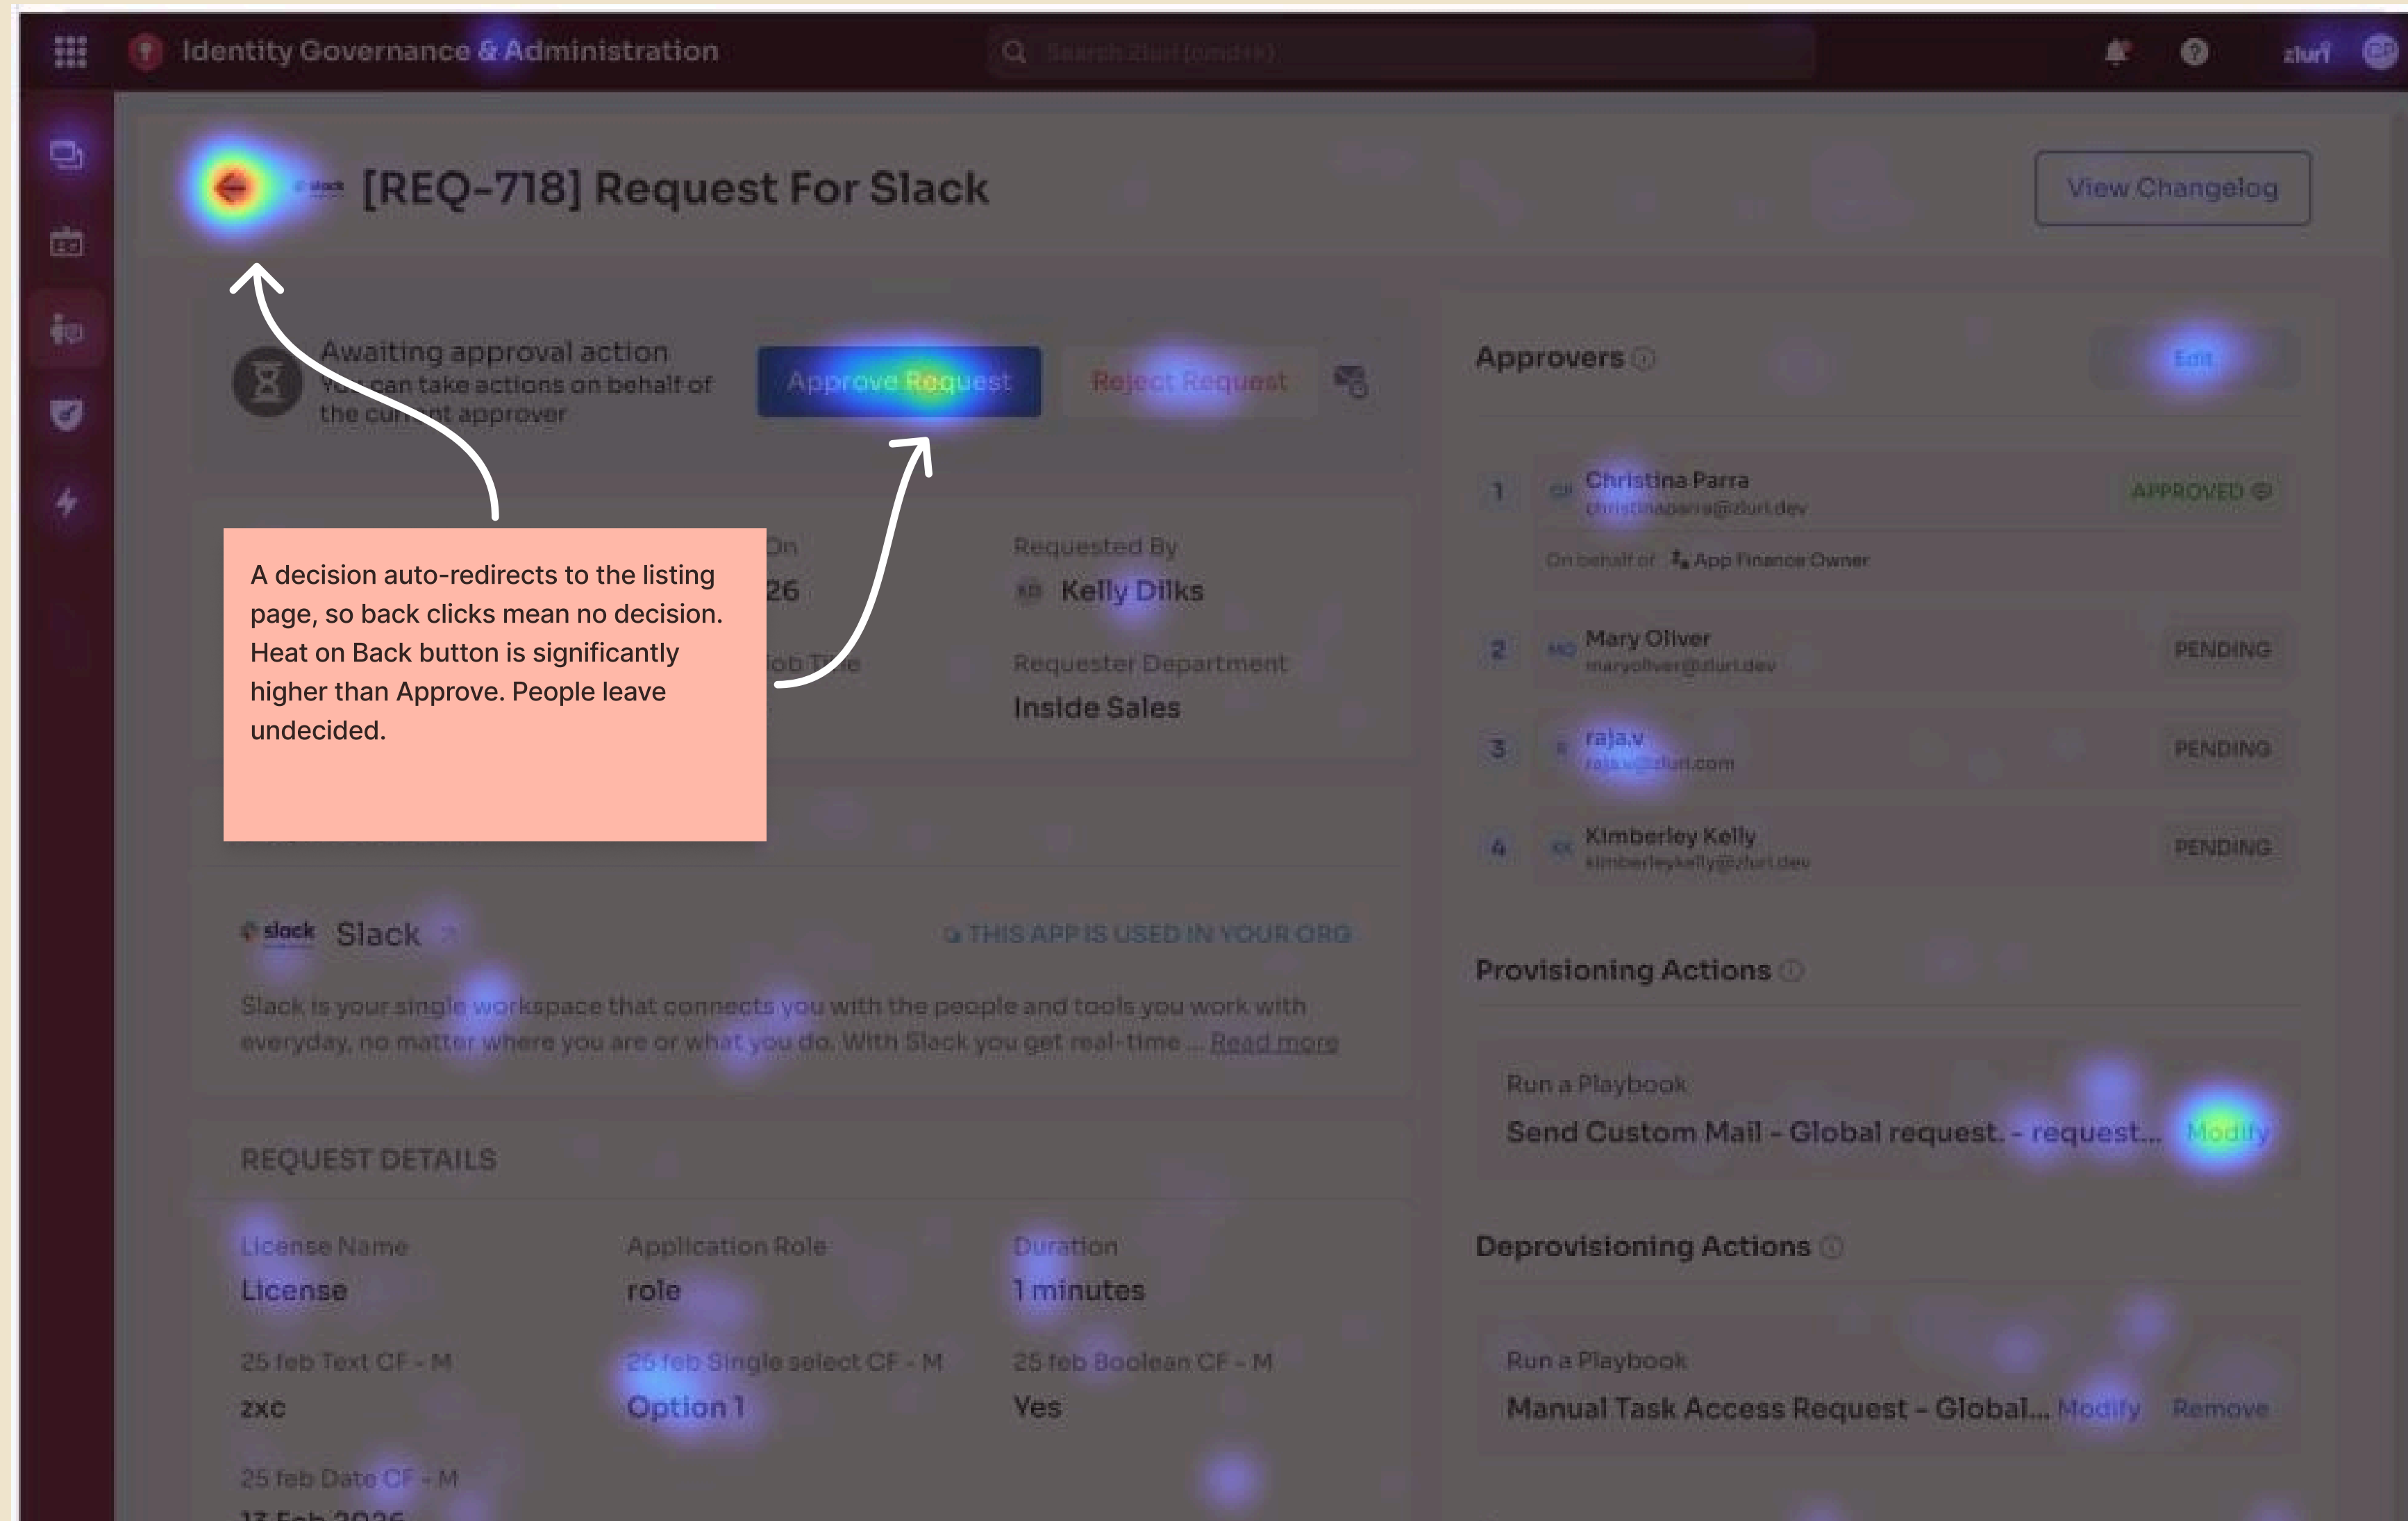

People context (2)

"Provide department context before granting approval."
— Harry's

"Include job title in the approval notification."
— OakNorth Bank

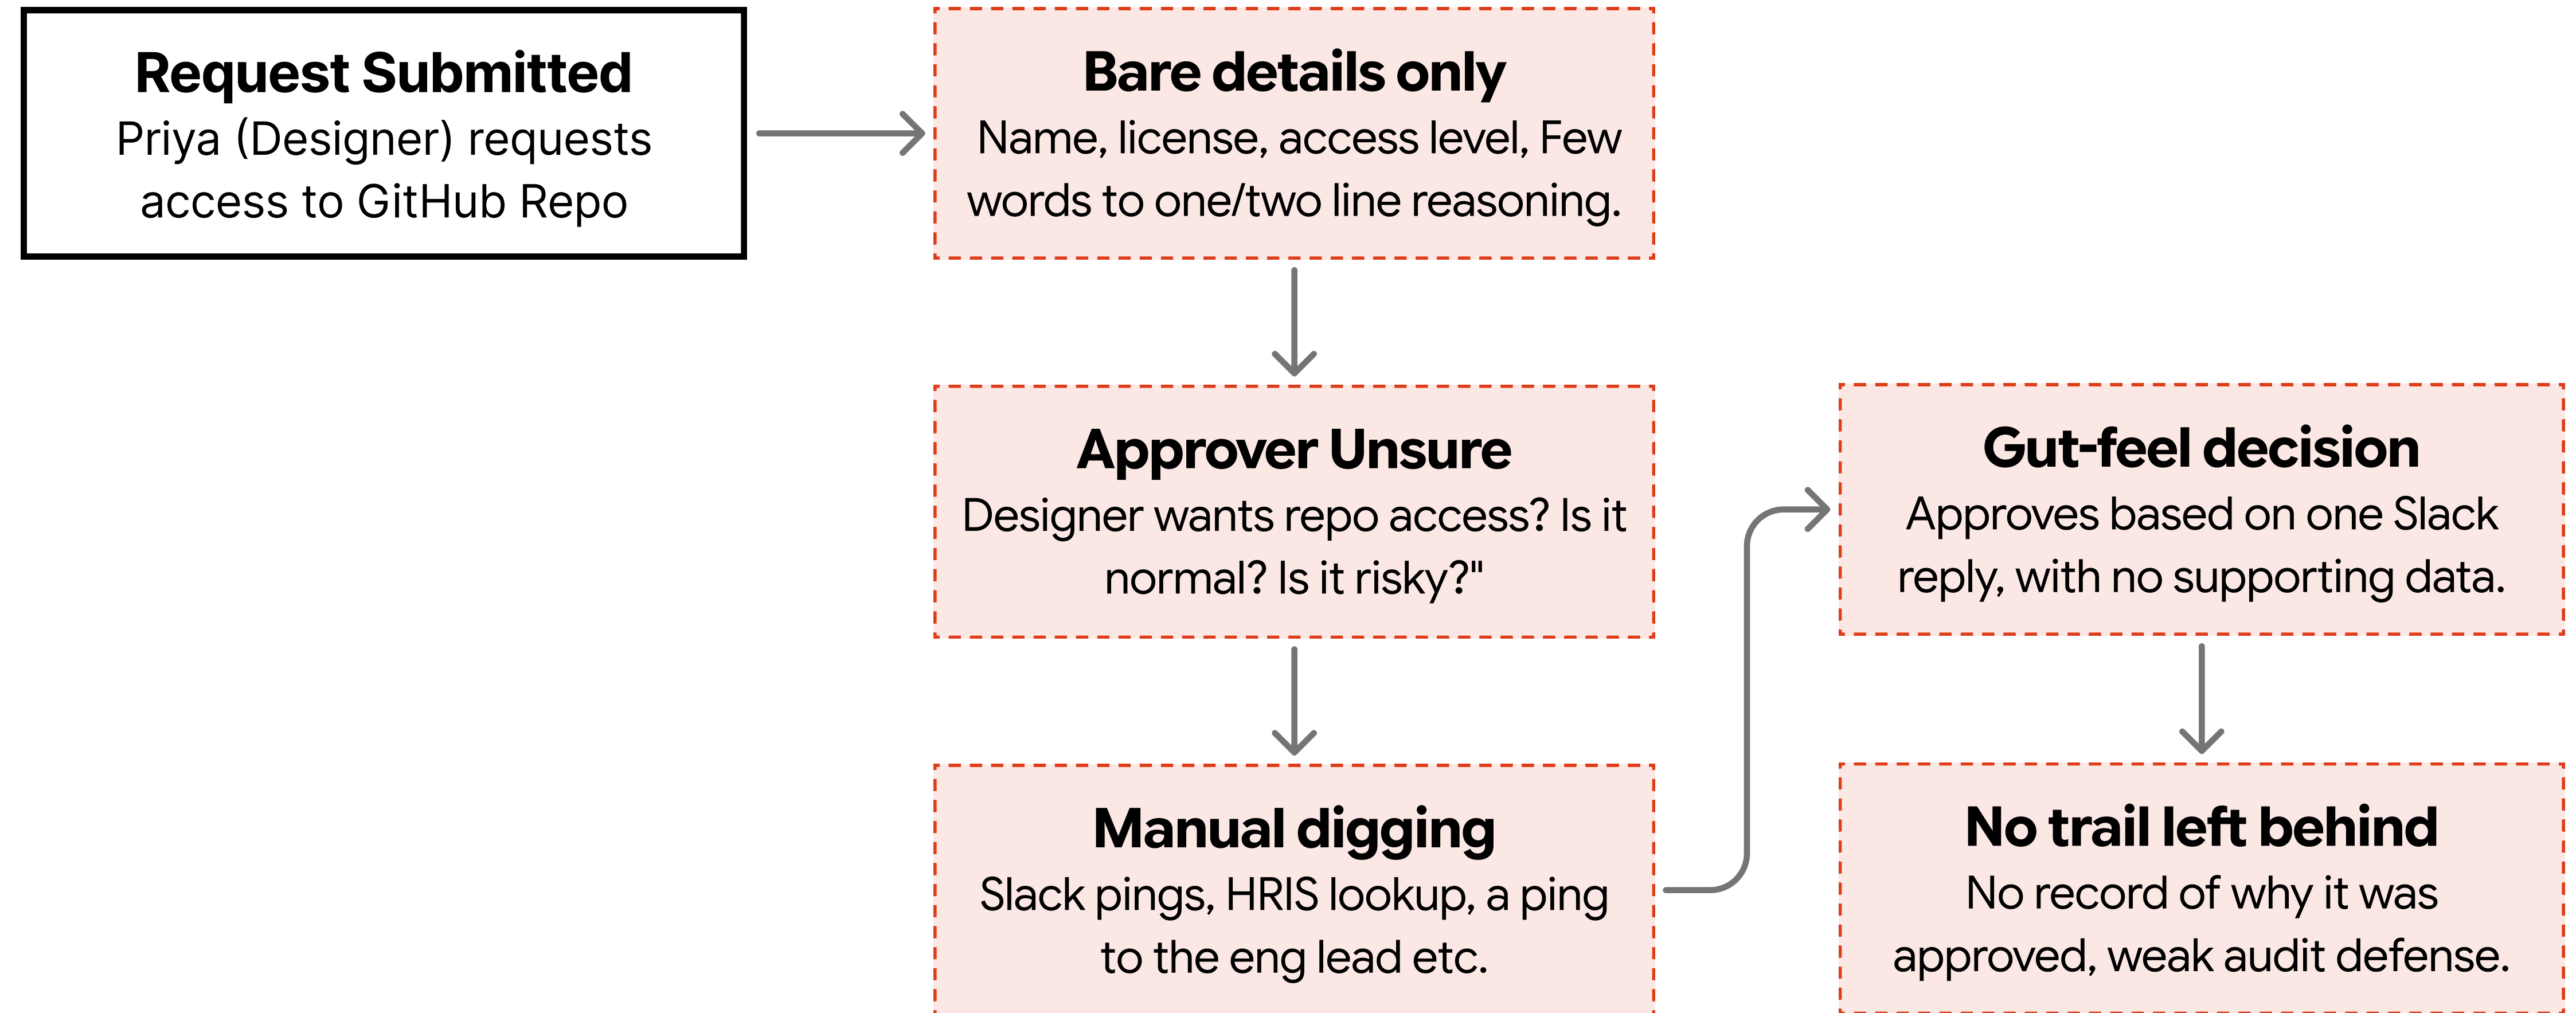

20 customer statements. 11 companies.

5 themes emerged. Double-confirms our learnings from competitor research, and it helped us prioritize feature scope.

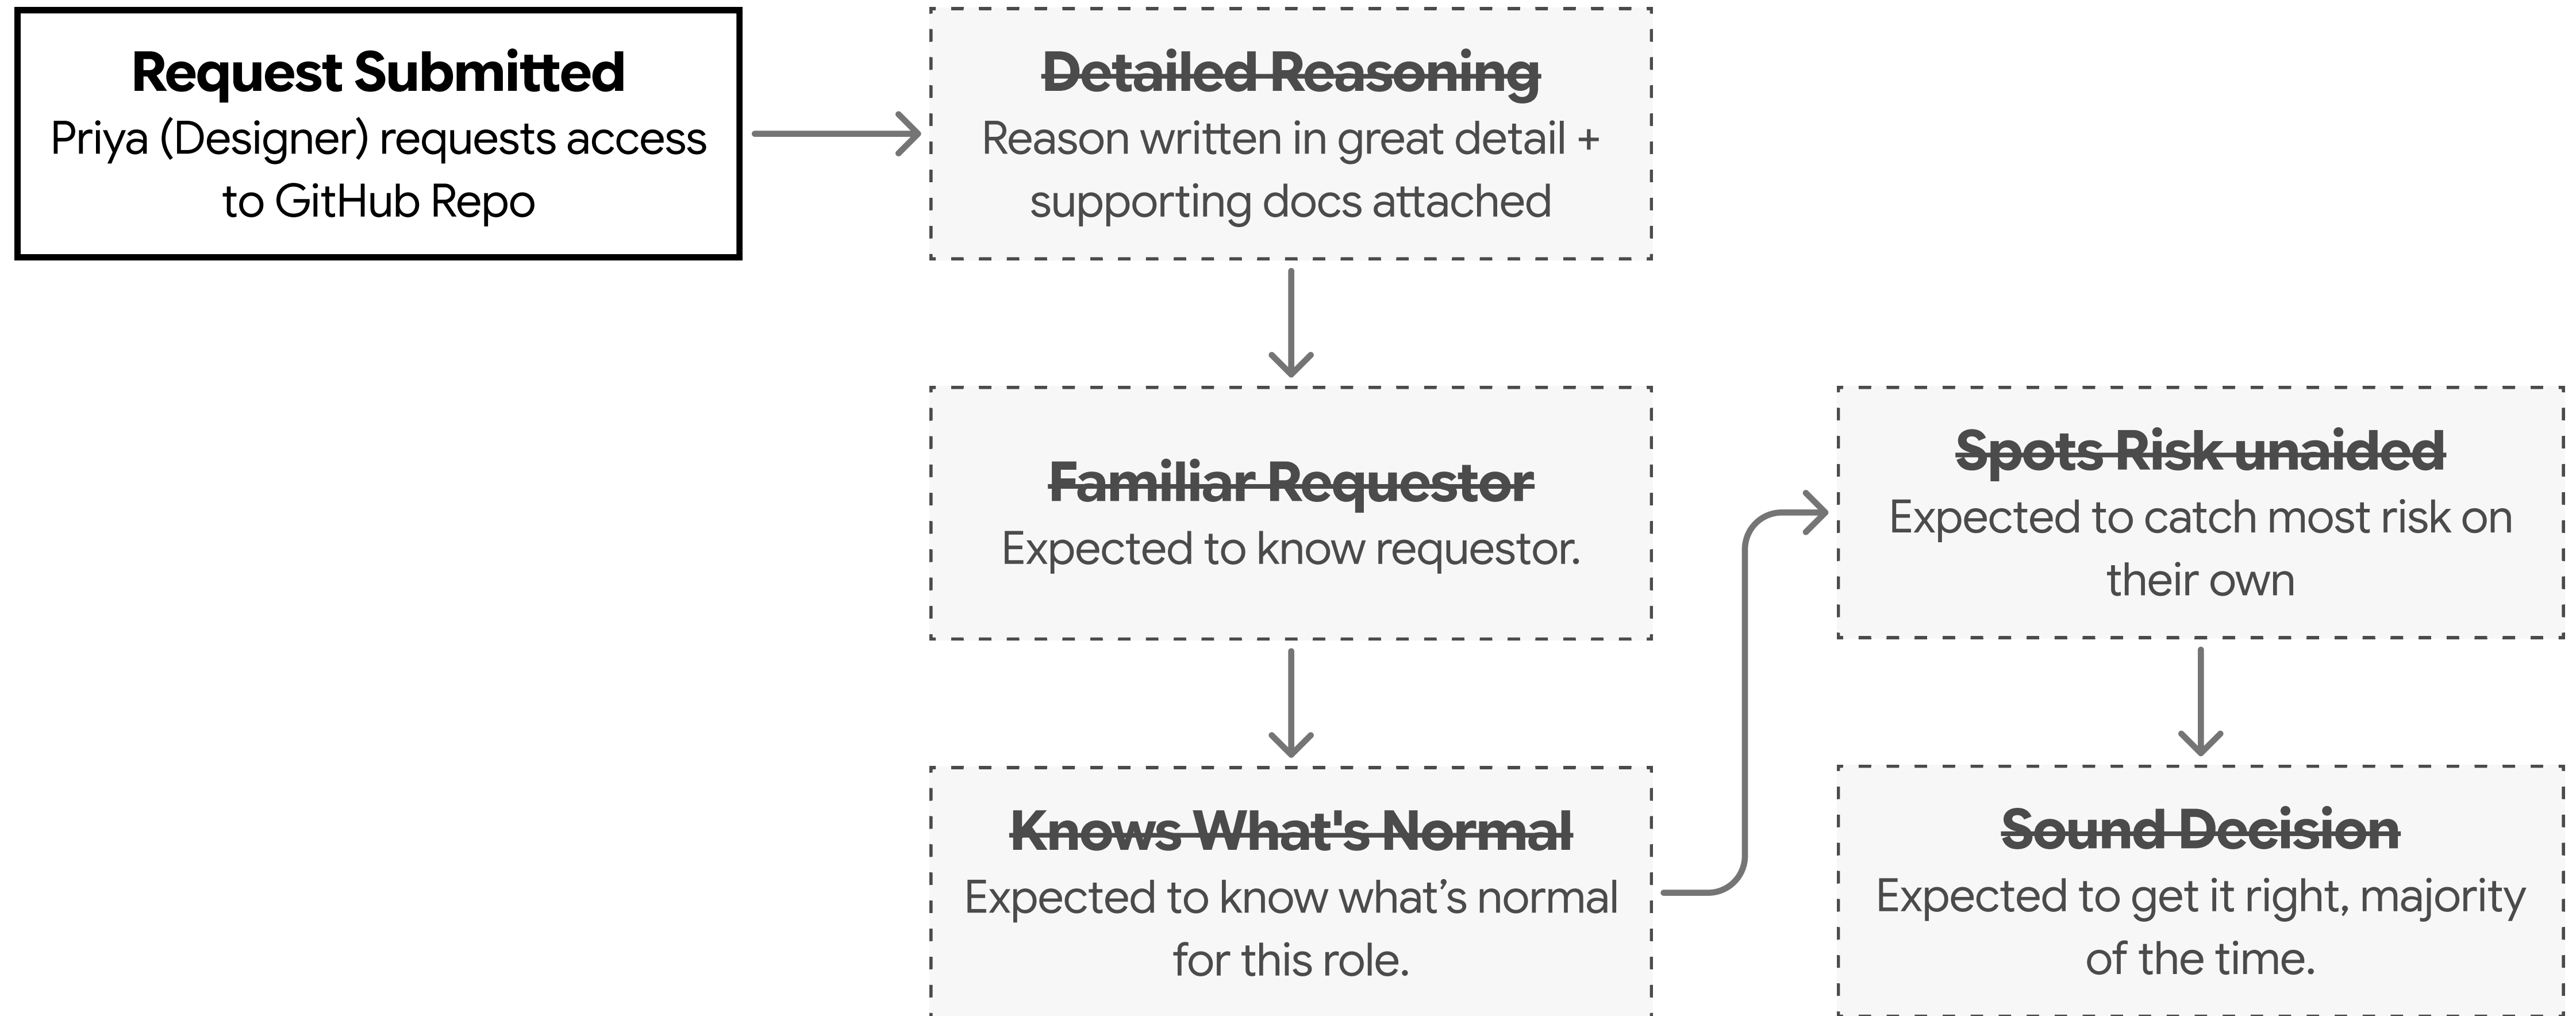

Key takeaway from heatmap analysis

Current reality

Current design was built for an approver who doesn't exist.

PRD readiness grows to 70-80% as discovery concludes. Design Begins

PRD covering goals, user stories, constraints, success criteria etc.

Access requests - Approver Insights

1. Objective

Enable approvers to make faster and more confident access decisions by surfacing contextual, data-driven insights directly within the request detail page — for managed applications only.

2. Problem Statement

In today's time approvers see:

- Requester info
- Application
- License / Role
- Business requirement
- Approve / Reject

However, they **do not see the contextual signals** needed to answer critical questions:

- Is this access normal for this role?
- Has this user asked before?
- Was it rejected earlier?
- Does the user already have similar access?
- Is this admin/privileged access?
- Is there another active request?
- What does this license cost?

Current Impact

- ***Approval decisions are subjective.***Approvers lack data to distinguish routine from anomalous requests.
- ***Increased approval time.***Approvers resort to manual, offline interventions to gather context.
- ***Higher chance of inappropriate approvals.***Without peer benchmarks or history, over-privileged access slips through.
- ***Poor audit defensibility.***No traceable, data-backed rationale exists for approval decisions.

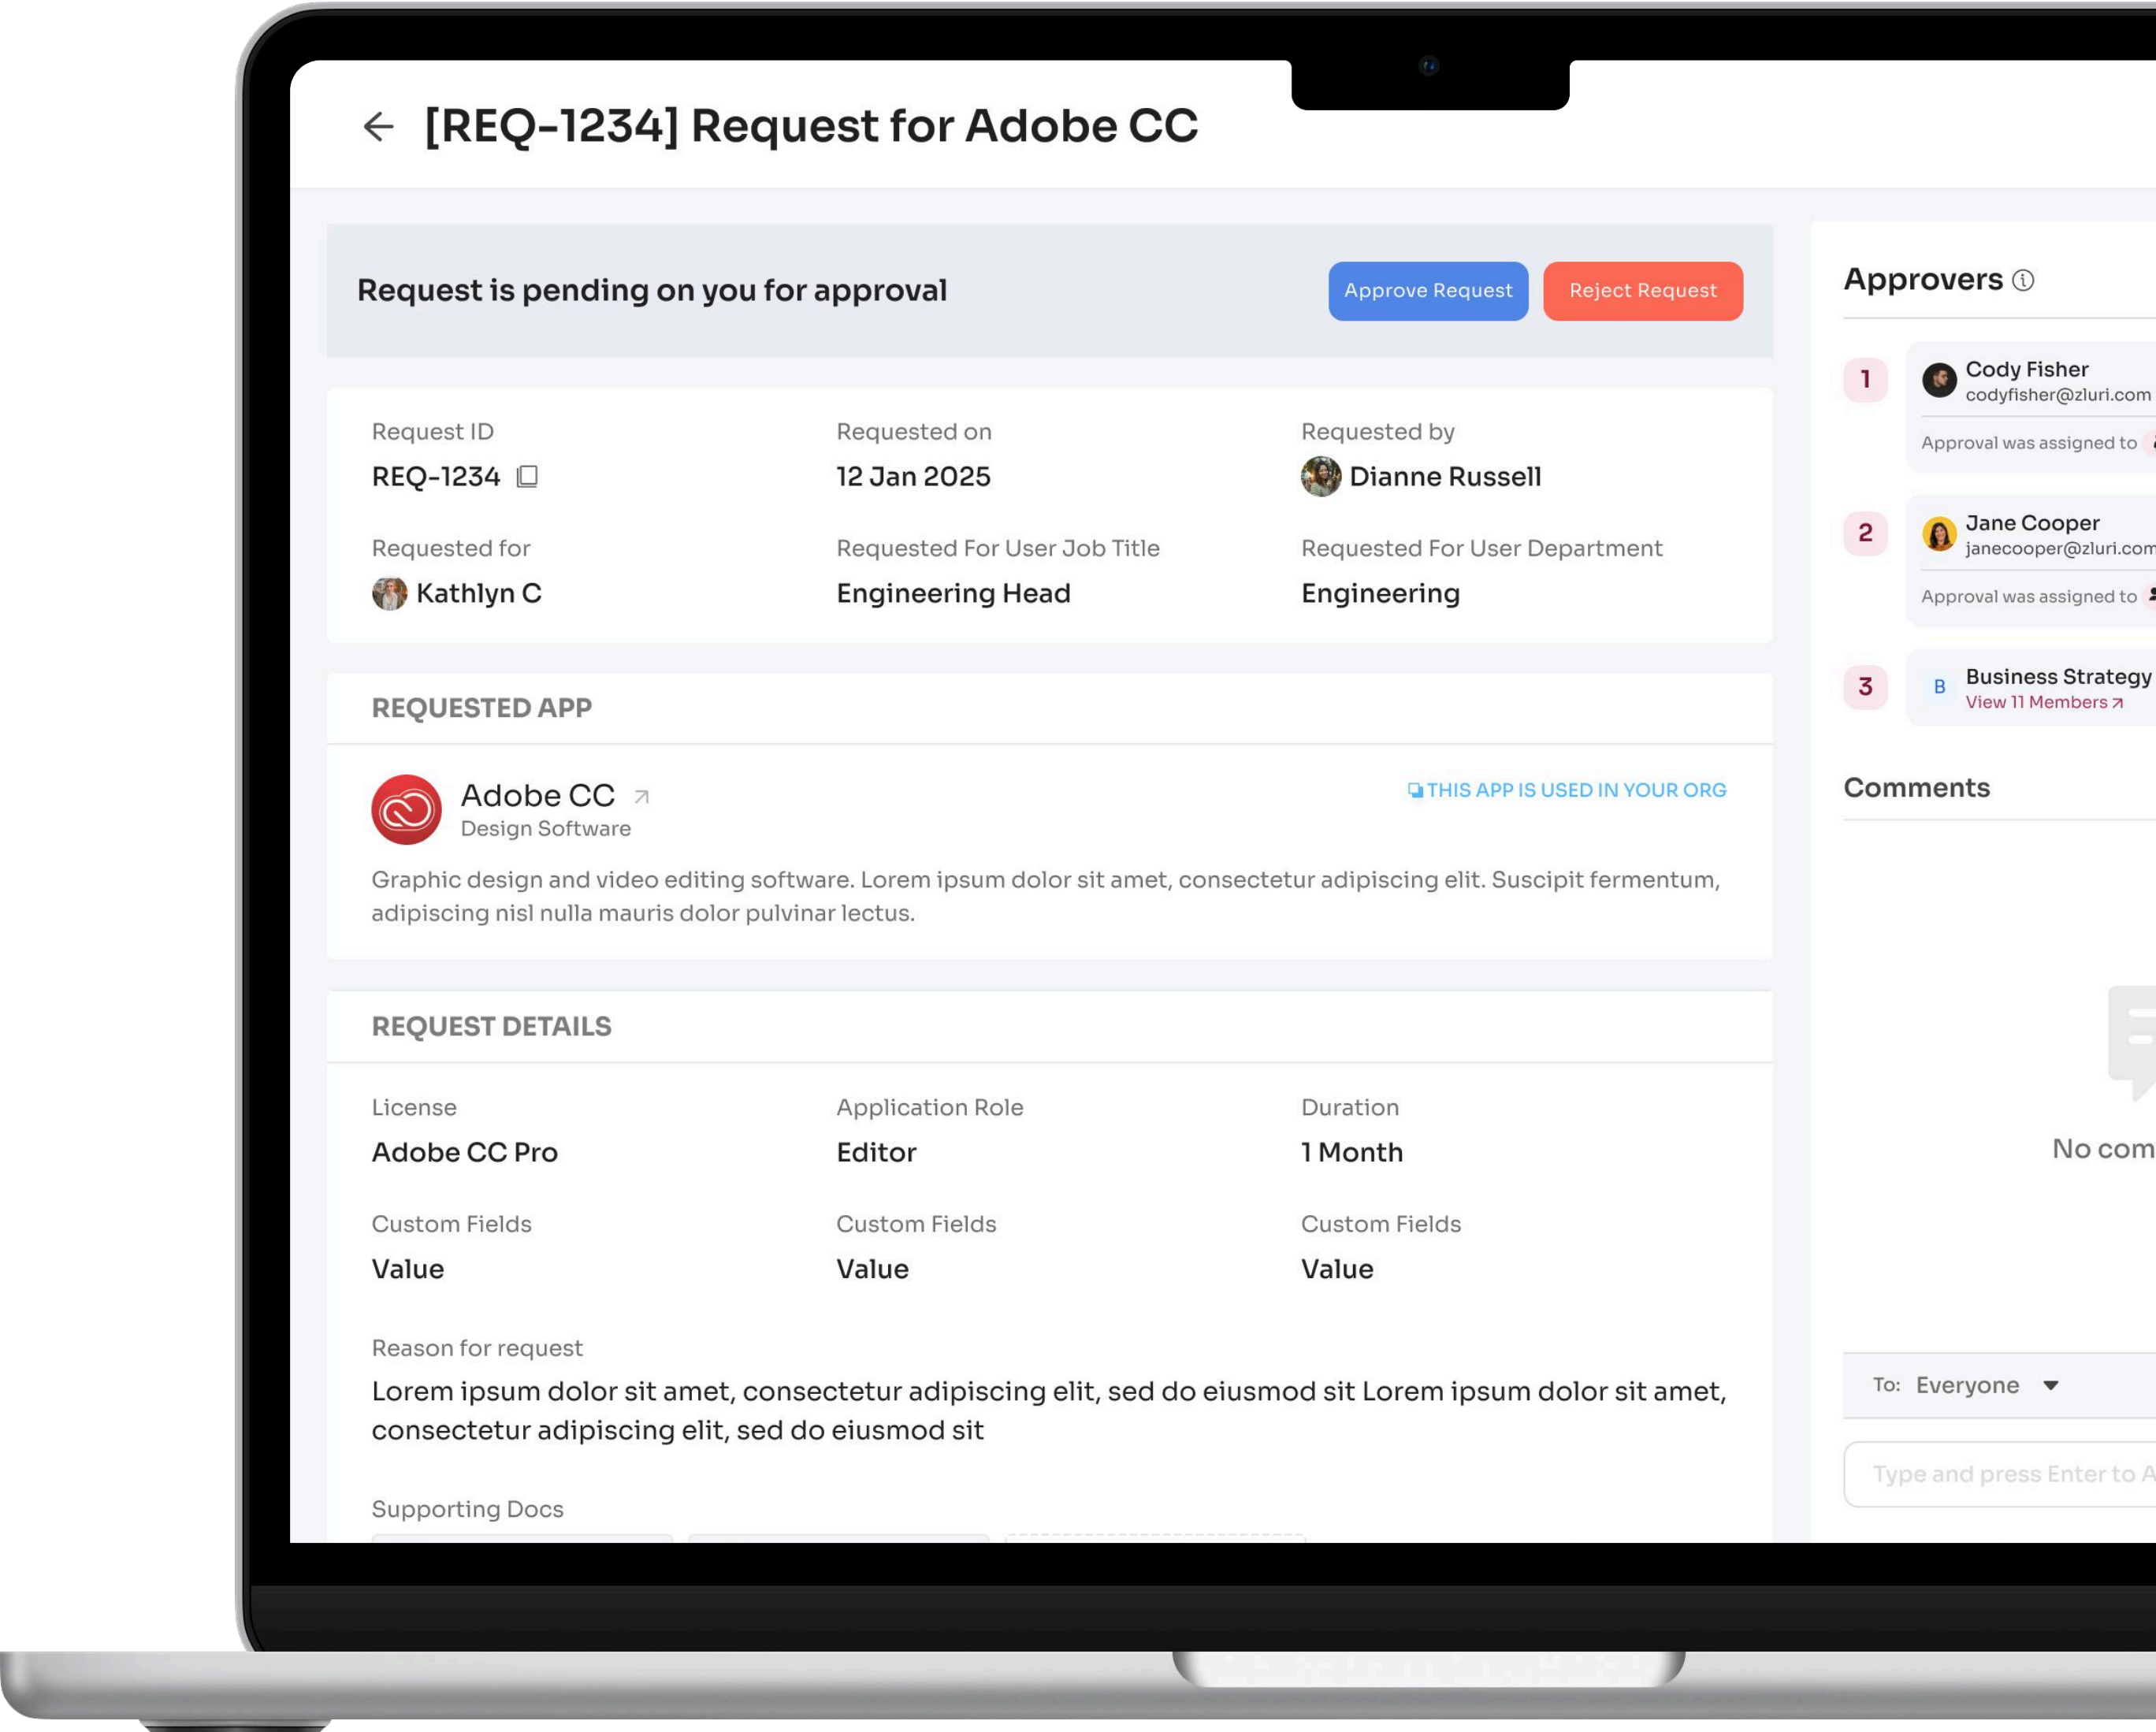

Scope: Two jobs, one page

Add AI-Insights beside decision area

Every review ends with Approve and Reject. That is where AI-Insights belongs.

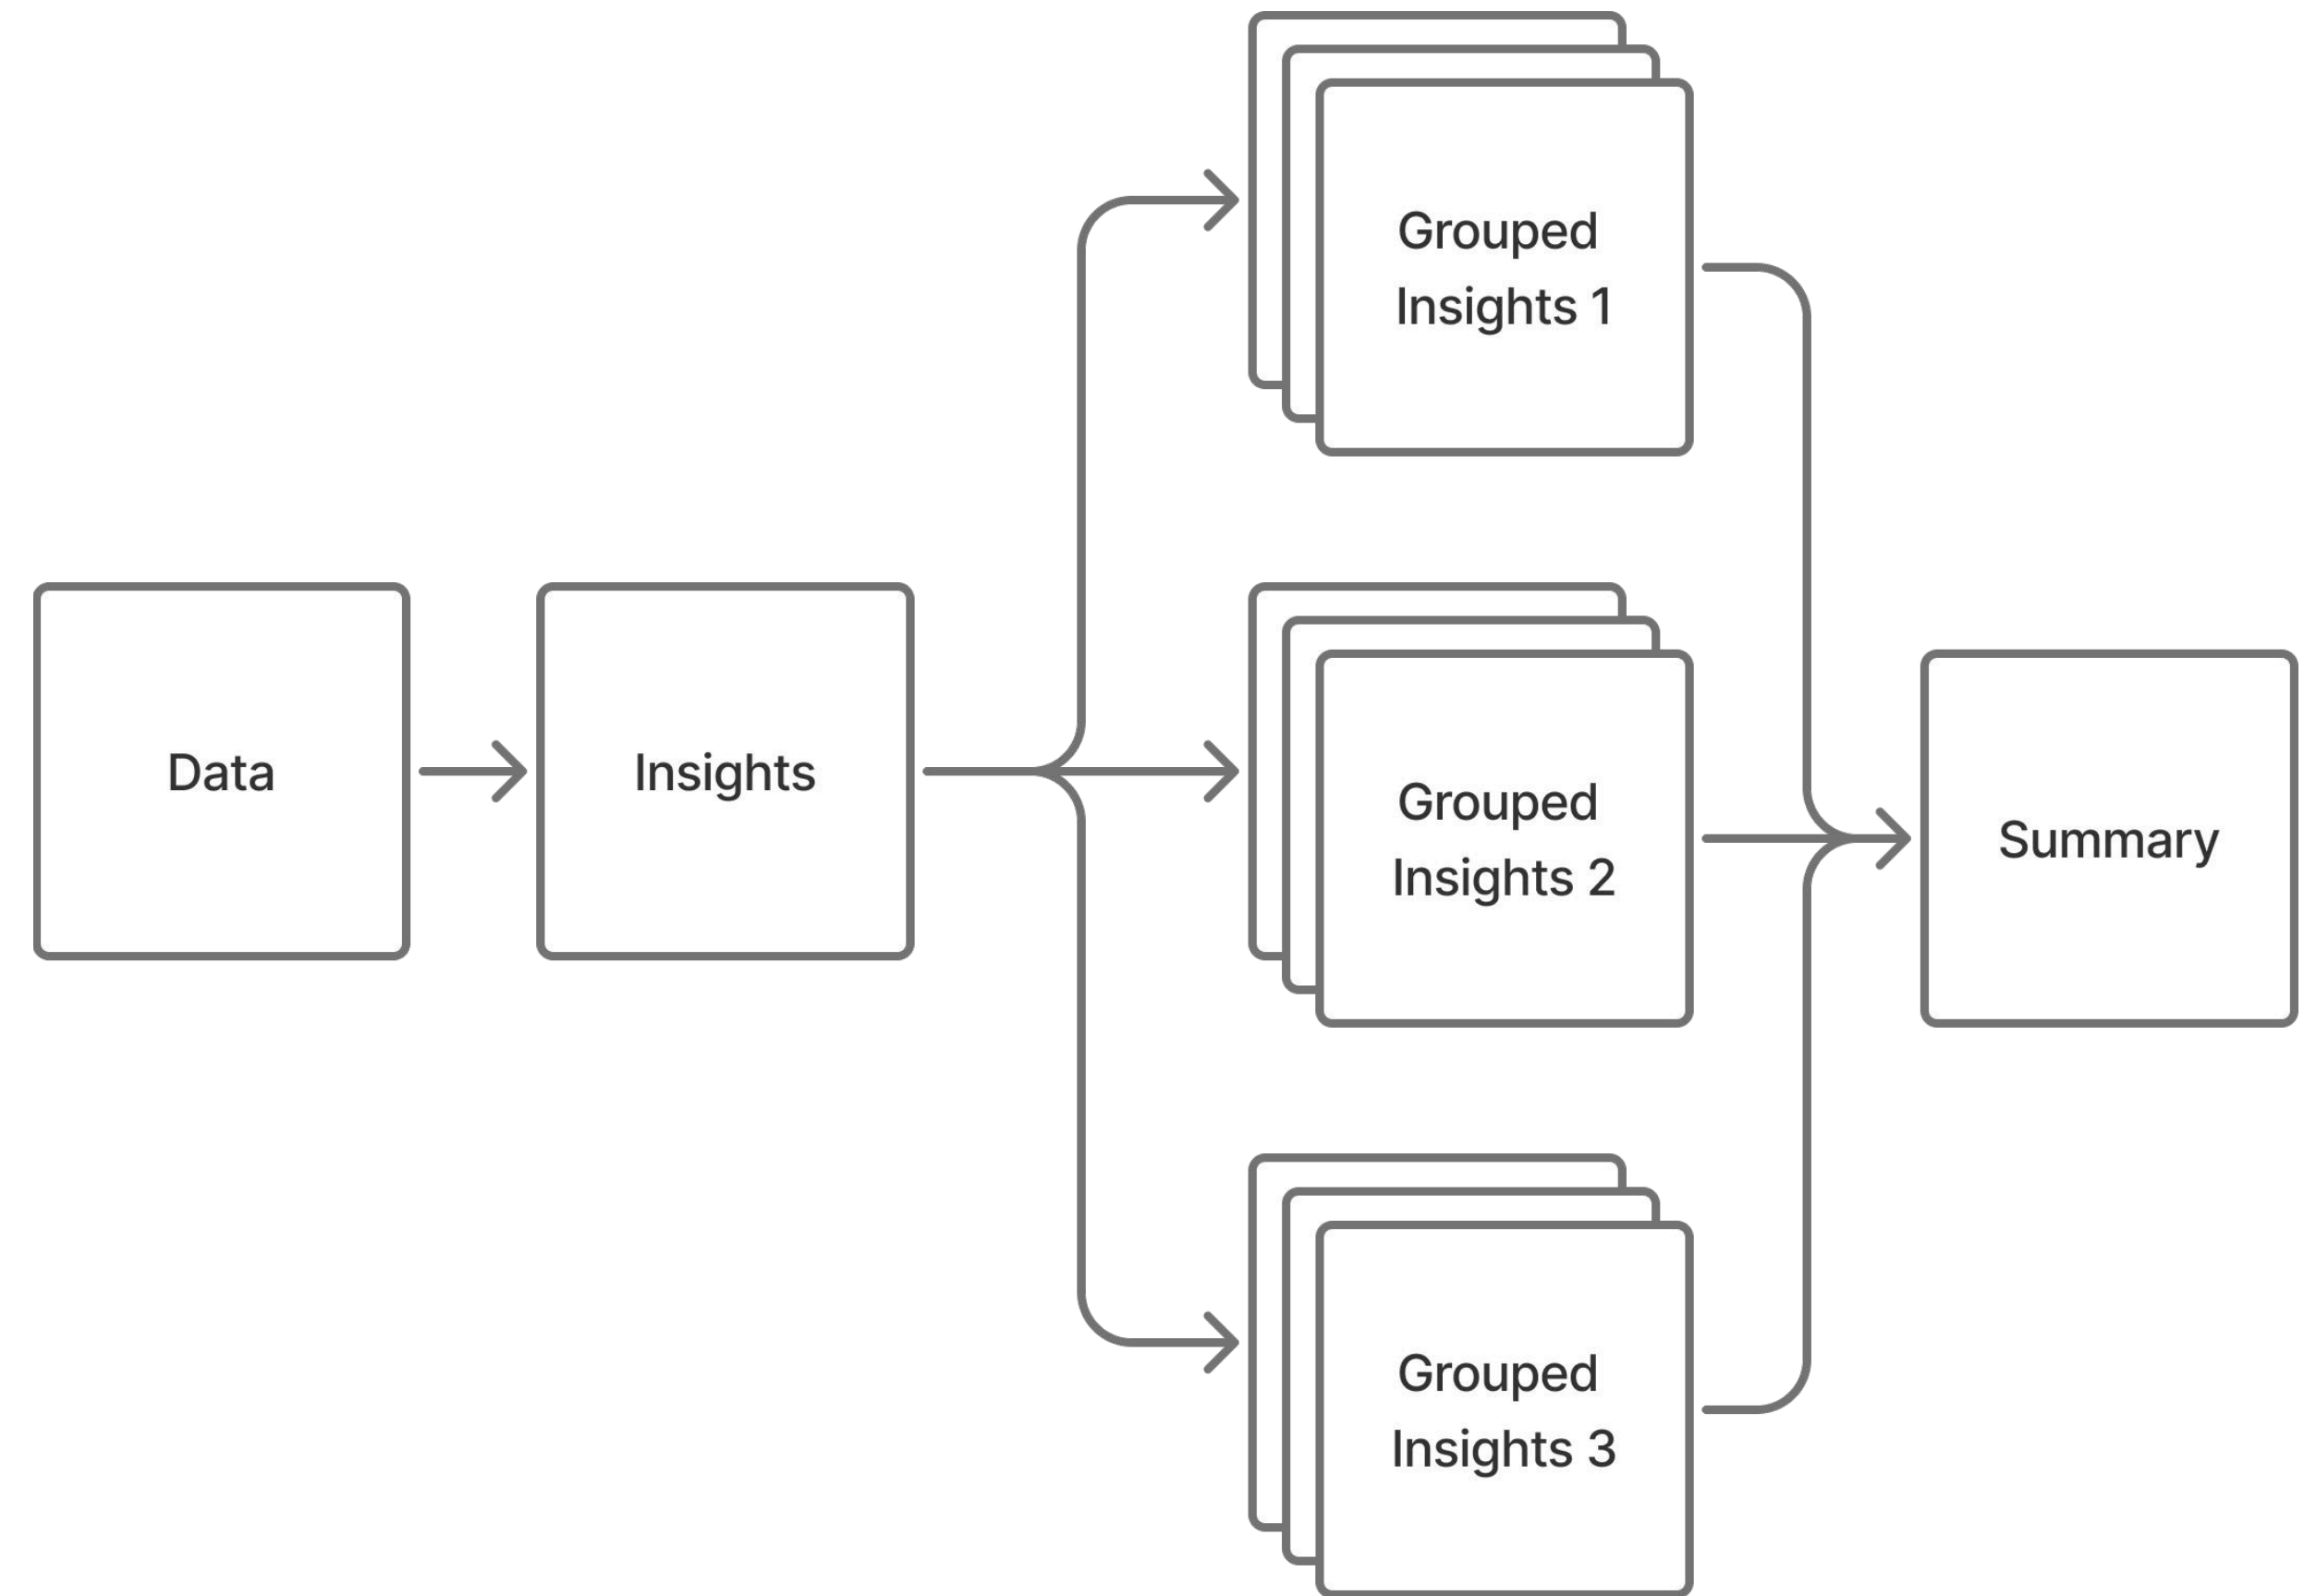

Revamp to the new design language

The legacy layout is dated, untidy and stretches with the screen. White space distracts and information feels scattered.

Making data decision-ready

1. Raw data becomes insights.
2. Related insights are grouped.
3. Only 3-5 decision-critical groups feed the summary.

Low fidelity: AI Prototype

Feedback on initial concept

- "It's too much info."
- "If we trust the summary, why show the breakdown upfront?"
- "Not every group is alarming. Why weigh them equally?"
- "Risk at group level or insight level?"

REQUEST IS PENDING ON YOU FOR APPROVAL

You are the reporting manager and should act on the current approval.

Mid fidelity: Summary + All facts

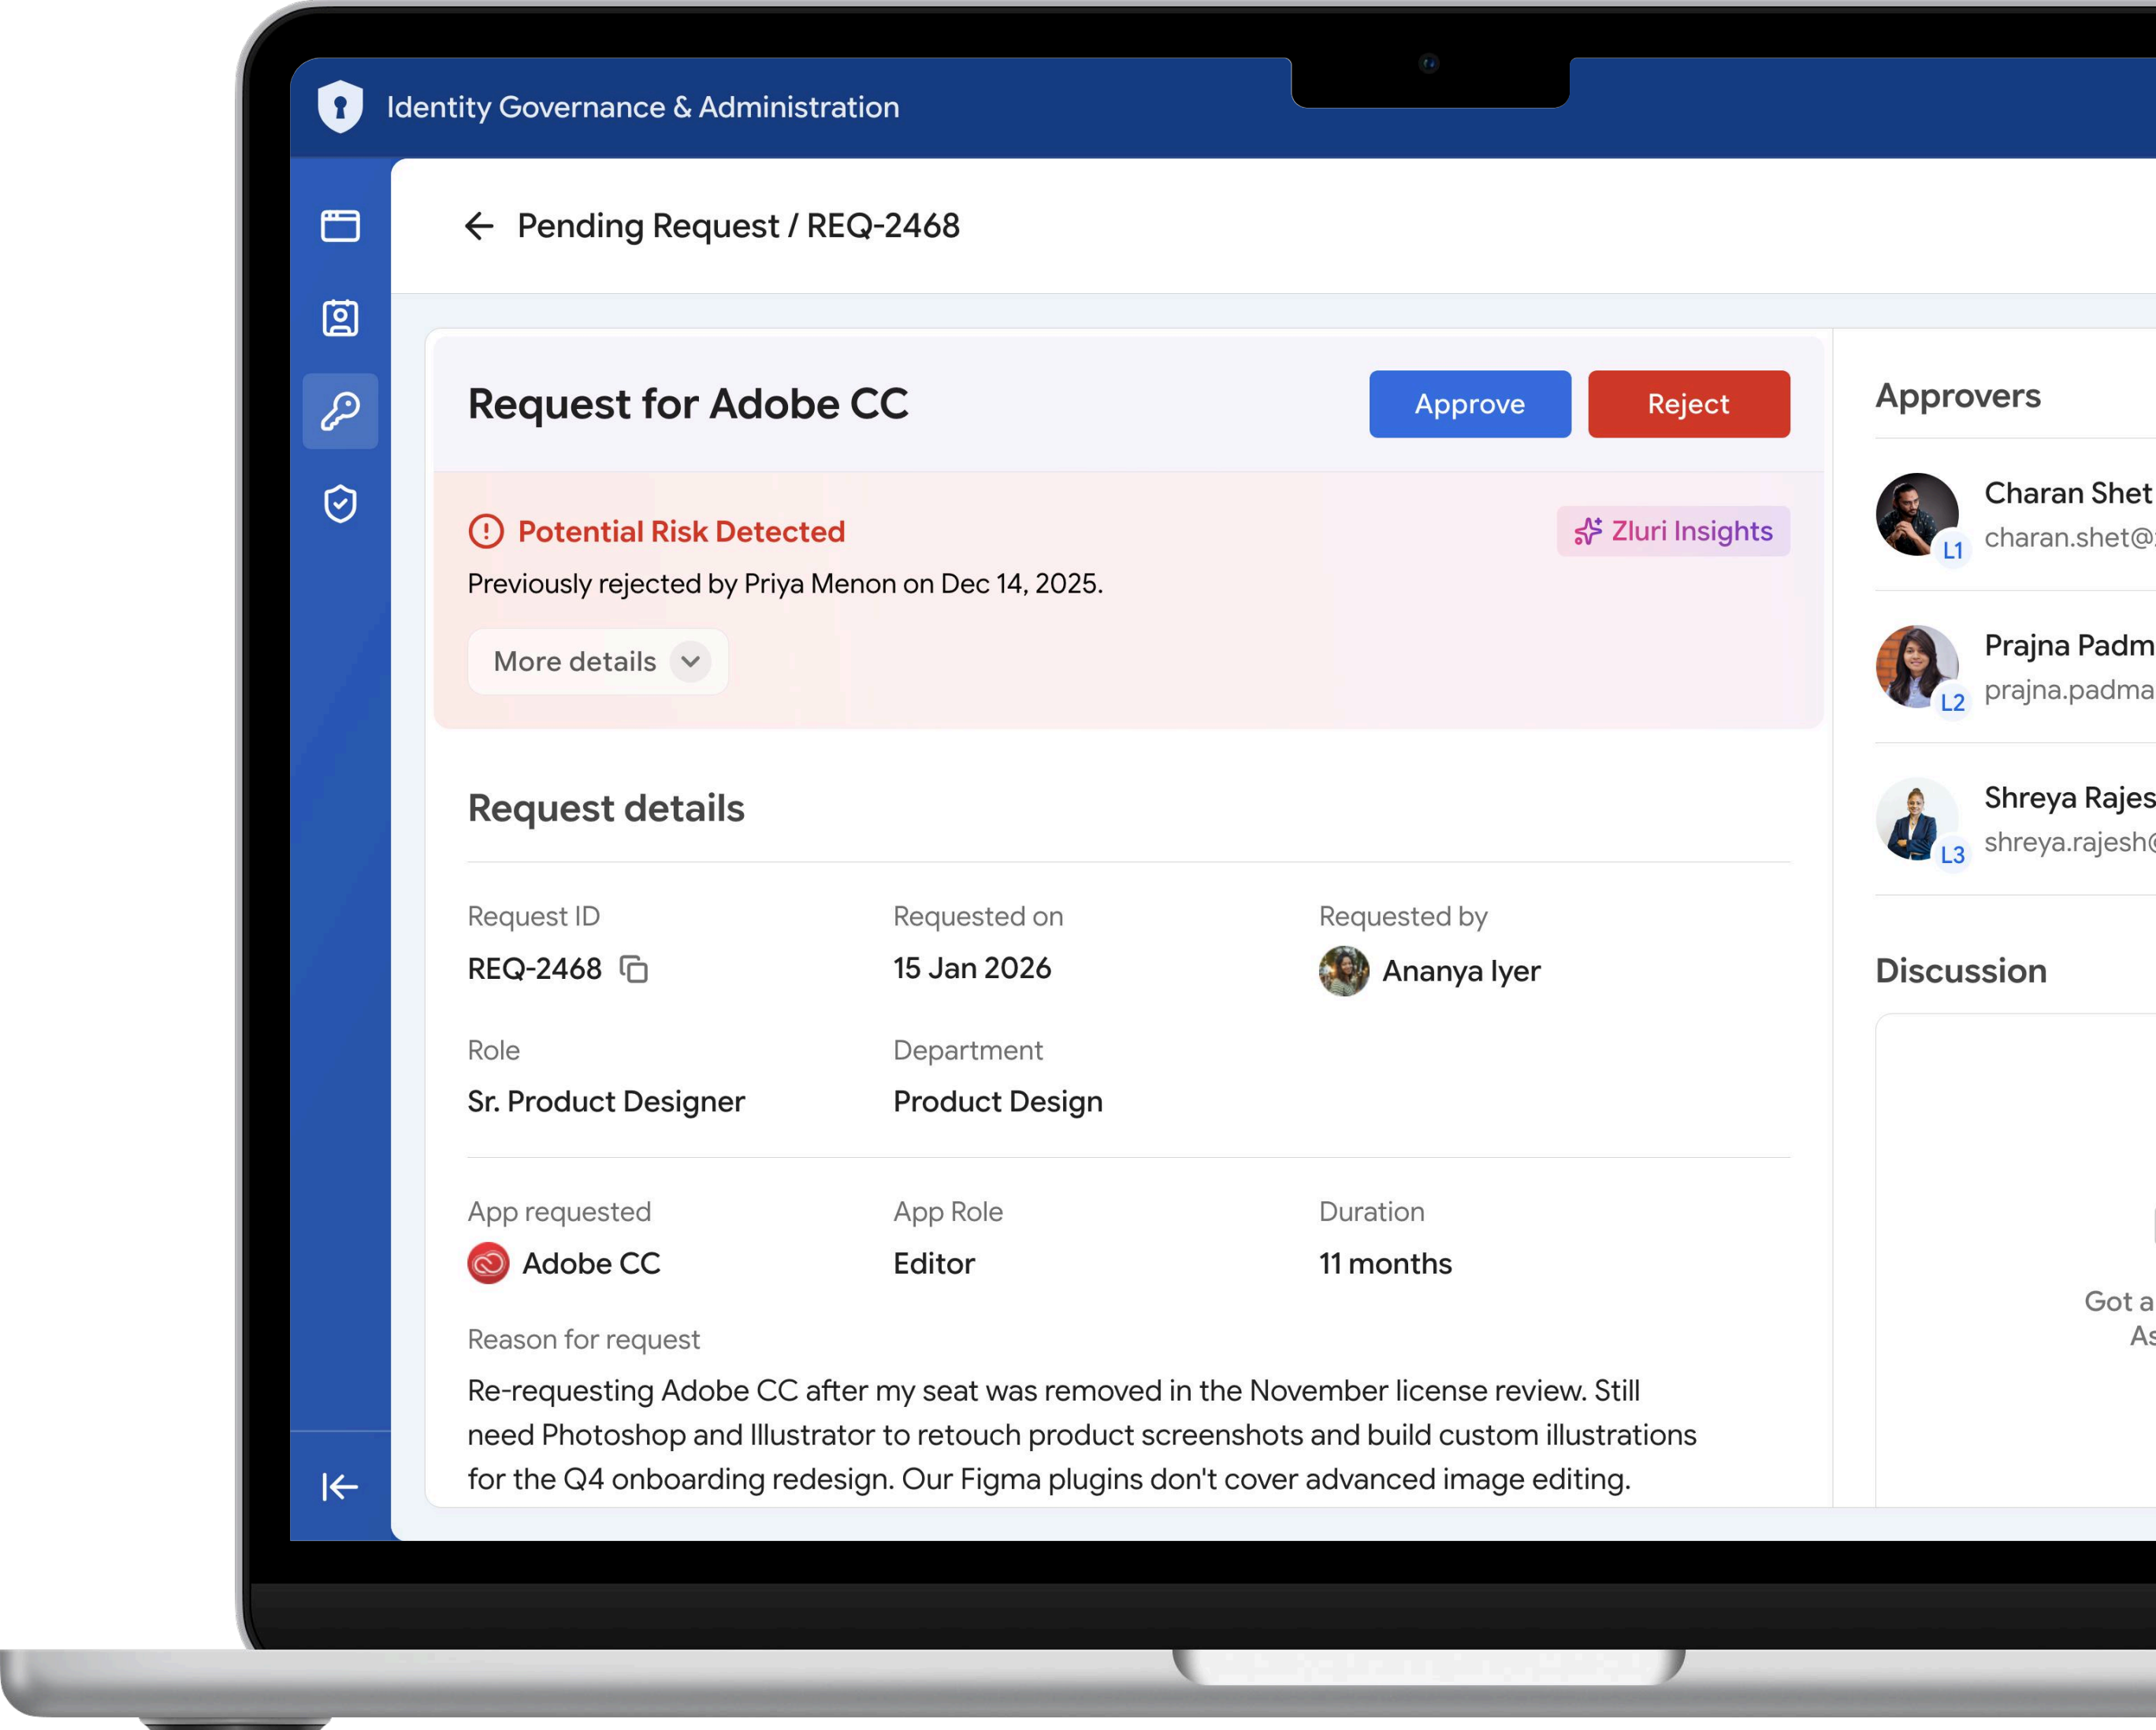

Chosen default view (Mid fidelity)

The AI synthesizes the risk. The approver makes the call.

What we did	Lead with the risk summary. Facts on demand. Facts are 1 or 2 clicks away for anyone who wants to investigate deeper.
Why this approach?	The real ROI of AI is synthesis. If approvers must read every fact to reach a conclusion, the AI has added nothing.

Final design: legacy UI moved to the new design language

Color signals the attention needed before anything is read.

Instant risk signaling

Green, amber and red register before the text does.

Lower cognitive effort

Approvers stop asking "How much time should I spend here?" Over time, they build an instinct to move fast or dig deeper.

Request for Adobe CC

ApproveReject

✔ Approval recommended. Typical Access.
52% of Product Designers have this role — common access.
